

DAC3174 Dual, 14-Bit, 500-MSPS, Digital-to-Analog Converter

1 Features

- Dual-Channel
- 14-Bit Resolution
- Maximum Sample Rate: 500 MSPS
- Pin Compatible With Dual-Channel DAC3154, DAC3164, and Single-Channel DAC3151, DAC3161, and DAC3171
- Input Interface:
 - 14 LVDS Inputs
 - Single, 14-Bit Interface or Dual, 7-Bit Interface
 - Single or Dual DDR Data Clock
 - Internal FIFO
- Chip-to-Chip Synchronization
- Power Dissipation: 460 mW
- Spectral Performance at 20 MHz IF:
 - SNR: 76 dBFS
 - SFDR: 78 dBc
- Current-Sourcing DACs
- Compliance Range: -0.5 V to $+1\text{ V}$
- Package: 64-Pin VQFN (9 mm × 9 mm)

2 Applications

- Multi-Carrier, Multi-Mode Cellular Infrastructure Base Stations
- Radar
- Signal Intelligence
- Software-Defined Radios
- Test and Measurement Instrumentation

3 Description

The DAC3174 is a dual-channel, 14-bit, 500-MSPS, digital-to-analog converter (DAC). The DAC3174 uses a 14-bit, low-voltage differential signaling (LVDS) digital bus, with one or two independent dual-data rate (DDR) data clocks for flexibility in providing data from different sources in each channel.

An input first-in first out block (FIFO) allows independent data and sample clocks. FIFO input and output pointers can be synchronized across multiple devices for precise signal synchronization.

The DAC outputs are current sourcing and terminate to GND with a compliance range of -0.5 V to $+1\text{ V}$.

The DAC3174 is pin compatible with the dual-channel, 500-MSPS, 12-bit DAC3164 and 10-bit DAC3154, and the single-channel, 500-MSPS, 14-bit DAC3171, 12-bit DAC3161, and 10-bit DAC3151.

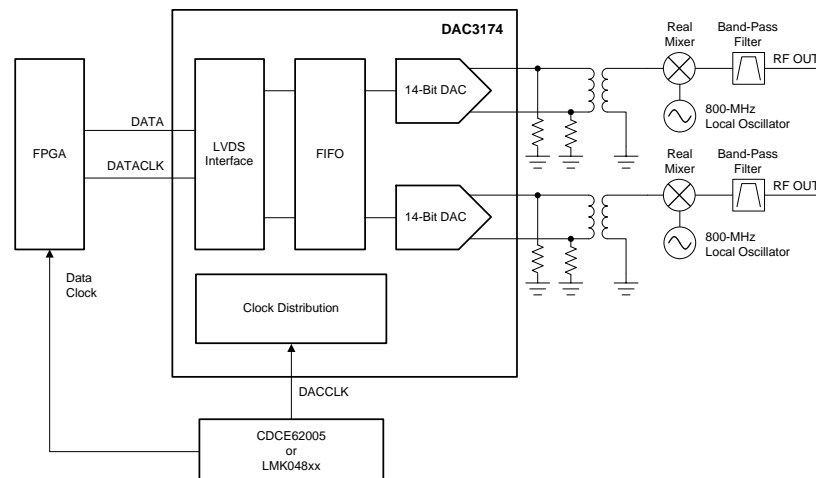

The device is available in a 64-pin VQFN PowerPAD™ package. and is specified over the full industrial temperature range of -40°C to $+85^{\circ}\text{C}$.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DAC3174	VQFN (64)	9.00 mm × 9.00 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

4 Revision History

Changes from Revision A (May 2013) to Revision B	Page
• Added <i>Device Information</i> , <i>ESD Ratings</i> , <i>Recommended Operating Conditions</i> , and <i>Timing Requirements</i> tables, and <i>Detailed Description</i> , <i>Application and Implementation</i> , <i>Power Supply Recommendations</i> , <i>Layout</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> sections	1
• Added typical application diagram to front page and moved existing block diagrams to <i>Functional Block Diagrams</i> section	1
• Added GND PAD row to <i>Pin Functions</i> table	4
• Added GND PAD row to <i>Pin Functions</i> table	6
• Changed both functional block diagrams for clarity.....	18
• Added definition for T = DACCLK period	20
• Added definition for T = DACCLK period	23
• Changed text in <i>FUSE controlled</i> bullet of <i>Register Maps</i> section for clarity.....	26

Changes from Original (April 2013) to Revision A	Page
• Deleted PRODUCT PREVIEW banner for device release	1

5 Pin Configuration and Functions

Pin Functions: Single-Bus Mode

PIN		I/O	DESCRIPTION
NAME	NO.		
CONTROL AND SERIAL			
ALARM	47	O	CMOS output for ALARM condition.
RESETB	41	I	Serial interface reset input, active low. Initialized internal registers during high-to-low transition. Asynchronous. Internal pullup. A reset event after every power cycle may be required to reinitialize all SPI registers to default values.
SCLK	43	I	Serial interface clock. Internal pulldown.
SDENB	42	I	Serial data enable. Internal pullup.
SDIO	44	I/O	Bidirectional serial data in 3-pin mode (default). In 4-pin interface mode (sif4_ena [config0, bit 9]), the SDIO pin in an input only. Internal pulldown.

DAC3174

SLAS837B – APRIL 2013–REVISED JANUARY 2017

www.ti.com
Pin Functions: Single-Bus Mode (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
SDO	46	O	Unidirectional serial interface data in 4-pin mode (sif4_ena [config0, bit 9]). The SDO pin is made high impedance in 3-pin interface mode (default). Internal pulldown.
SLEEP	49	I	Puts device in sleep, active high. Internal pulldown.
TXENABLE	48	I	Transmit enable, active high input. TXENABLE must be high for the data to the DAC to be enabled. When TXENABLE is low, the digital logic section is forced to all 0, and any input data are ignored. Internal pulldown.
DATA INTERFACE			
ALIGNN	5	I	LVPECL FIFO output synchronization. This positive or negative pair is captured with the rising edge of DACCLKx. This pin is used to reset the clock dividers and for multiple DAC synchronization. If unused, this pin can be left unconnected.
ALIGNP	4	I	
DATA[13:0]N	10, 12, 14, 16, 18, 20, 23, 27, 30, 32, 34, 36, 38, 40	I	LVDS input data bits for both channels. Each positive and negative LVDS pair has an internal 100-Ω termination resistor. Data format relative to DATACLKx clock is dual data rate (DDR) with two data transfers per DATACLKx clock cycles. The data format is interleaved with channel A (rising edge) and channel B (falling edge). In the default mode (reverse bus not enabled): DATA13x is most significant data bit (MSB) DATA0x is least significant data bit (LSB)
DATA[13:0]P	9, 11, 13, 15, 17, 19, 22, 26, 29, 31, 33, 35, 37, 39	I	
DATACLKN	25	I	DDR differential input data clock. Edge to center nominal timing. Ch A rising edge, Ch B falling edge in multiplexed output mode.
DATACLKP	24	I	
SYNCP	6	I	This pin resets the FIFO or is used as a syncing source. These two functions are captured with the rising edge of DATACLKx. The signal captured by the falling edge of DATACLKx.
SYNCP	7	I	
OUTPUT AND CLOCK			
DACCLKN	2	I	LVPECL clock input for DAC core with a self-bias of approximately CLKVDD18 / 2.
DACCLKP	1	I	
IOUTAN	60	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full-scale current source, and the most positive voltage on the IOUTAP pin. Similarly, a 0xFFFF data input results in a 0-mA current source, and the least positive voltage on the IOUTAP pin. The IOUTAN pin is the complement of IOUTAP.
IOUTAP	61	O	
IOUTBN	54	O	B-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full-scale current source, and the most positive voltage on the IOUTBP pin. Similarly, a 0xFFFF data input results in a 0-mA current source, and the least positive voltage on the IOUTBP pin. The IOUTBN pin is the complement of IOUTBP.
IOUTBP	53	O	
REFERENCE			
BIASJ	57	O	Full-scale output current bias. For 20-mA full-scale output current, connect a 960-Ω resistor to GND.
EXTIO	58	I/O	Used as external reference input when internal reference is disabled. Requires a 0.1-μF decoupling capacitor to GND when used as reference output.
POWER SUPPLY			
CLKVDD18	3	I	1.8-V clock supply.
DIGVDD18	21, 28	I	1.8-V digital supply. Also supplies LVDS receivers.
IOVDD	45	I	Supply voltage for CMOS I/Os. 1.8 V to 3.3 V.
VDDA18	50, 64	I	Analog 1.8-V supply.
VDDA33	55, 56, 59	I	Analog 3.3-V supply.
VFUSE	8	I	Digital supply voltage (1.8 V). This supply pin is also used for factory fuse programming. Connect to DVDD pins for normal operation.
NC	51, 52, 62, 63	—	Not used. These pins can be left open or tied to ground in actual application use.
GND PAD	—	—	This thermal pad is the electrical ground connection for the device (backside).

Pin Functions: Dual-Bus Mode

PIN		I/O	DESCRIPTION
NAME	NO.		
CONTROL AND SERIAL			
ALARM	47	O	CMOS output for alarm condition.
RESETB	41	I	Serial interface reset input, active low. Initializes internal registers during high to low transition. Asynchronous. Internal pullup. A reset event after every power cycle may be required to reinitialize all SPI registers to default values.
SCLK	43	I	Serial interface clock. Internal pulldown.
SDENB	42	I	Serial data enable. Internal pullup.
SDIO	44	I/O	Bidirectional serial data in 3-pin mode (default). In 4-pin interface mode (sif4_ena [config0, bit 9]), the SDIO pin in an input only. Internal pulldown.

Pin Functions: Dual-Bus Mode (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
SDO	46	O	Unidirectional serial interface data in 4-pin mode (sif4_ena [config0, bit 9]). The SDO pin is made high impedance in 3-pin interface mode (default). Internal pulldown.
SLEEP	49	I	Puts device in sleep, active high. Internal pulldown.
TXENABLE	48	I	Transmit enable, active high input. TXENABLE must be high for the data to the DAC to be enabled. When TXENABLE is low, the digital logic section is forced to all 0, and any input data are ignored. Internal pulldown.
DATA INTERFACE			
DA[6:0]N	10, 12, 14, 16, 18	I	LVDS positive input data bits for channel A. Each positive or negative LVDS pair has an internal 100-Ω termination resistor. Data format relative to DA_CLKx clock is dual data rate (DDR) with two data transfers per DA_CLKx clock cycle. The data format is 7 MSBs (rising edge) and 7 LSBs (falling edge). In the default mode (reverse bus not enabled): DA6x is most significant data bit (MSB) DA0x is least significant data bit (LSB)
DA[6:0]P	9, 11, 13, 15, 17, 19	I	
DB[6:0]N	27, 30, 32, 34, 36, 38, 40	I	LVDS positive input data bits for channel B. Each positive or negative LVDS pair has an internal 100-Ω termination resistor. Data format relative to DB_CLKx clock is dual data rate (DDR) with two data transfers per DB_CLKx clock cycle. The data format is 7 MSBs (rising edge) and 7 LSBs (falling edge). In the default mode (reverse bus not enabled): DB6x is most significant data bit (MSB) DB0x is least significant data bit (LSB)
DB[6:0]P	26, 29, 31, 33, 35, 37, 39	I	
DA_CLKN	7	I	DDR differential input data clock for channel A. Edge to center nominal timing.
DA_CLKP	6	I	
DB_CLKN	25	I	DDR differential input data clock for channel B. Edge to center nominal timing.
DB_CLKP	24	I	
OUTPUT AND CLOCK			
DACCLKN	2	I	LVPECL clock negative input for DAC core with a self-bias of approximately CLKVDD18 / 2.
DACCLKP	1	I	LVPECL clock positive input for DAC core with a self-bias of approximately CLKVDD18 / 2.
IOUTAN	60	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full-scale current source, and the most positive voltage on the IOUTAP pin. Similarly, a 0xFFFF data input results in a 0-mA current source, and the least positive voltage on the IOUTAP pin. The IOUTAN pin is the complement of IOUTAP.
IOUTAP	61	O	
IOUTBN	54	O	B-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full-scale current source, and the most positive voltage on the IOUTBP pin. Similarly, a 0xFFFF data input results in a 0-mA current source, and the least positive voltage on the IOUTBP pin. The IOUTBN pin is the complement of IOUTBP.
IOUTBP	53	O	
REFERENCE			
BIASJ	57	O	Full-scale output current bias. For 20-mA full-scale output current, connect a 960-Ω resistor to GND.
EXTIO	58	I/O	Used as external reference input when internal reference is disabled. Requires a 0.1-μF decoupling capacitor to GND when used as reference output.
POWER SUPPLY			
CLKVDD18	3	I	1.8-V clock supply.
DIGVDD18	21, 28	I	1.8-V digital supply. Also supplies LVDS receivers.
IOVDD	45	I	Supply voltage for CMOS I/Os. 1.8 V to 3.3 V.
VDDA18	50, 64	I	Analog 1.8-V supply.
VDDA33	55, 56, 59	I	Analog 3.3-V supply.
VFUSE	8	I	Digital supply voltage (1.8 V). This supply pin is also used for factory fuse programming. Connect to DVDD pins for normal operation.
NC	4, 5, 51, 52, 62, 63	—	Not used. In actual application, pins 51, 52, 62, and 63 can be left open or tied to ground. TI recommends tying pins 4 and 5 to DIGVDD18 and ground, respectively.
GND PAD	—	—	This thermal pad is the electrical ground connection for the device (backside).

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	VDDA33 to GND	−0.5	4	V
	VDDA18 to GND	−0.5	2.3	
	CLKVDD18 to GND	−0.5	2.3	
	IOVDD to GND	−0.5	4	
	DIGVDD18 to GND	−0.5	2.3	
Terminal voltage	CLKVDD18 to DIGVDD18	−0.5	0.5	V
	VDDA18 to DIGVDD18	−0.5	0.5	
	DA[6:0]P, DA[6:0]N, DB[6:0]P, DB[6:0]N, D[13:0]P, D[13:0]N, DATACLKP, DATACLKN, DA_CLKP, DA_CLKPN, DB_CLKP, DB_CLKN, SYNCN, SYNCN to GND	−0.5	DIGVDD18 + 0.5	
	DACCLKP, DACCLKN, ALIGNP, ALIGNN	−0.5	CLKVDD18 + 0.5	
	TXENABLE, ALARM, SDO, SDIO, SCLK, SDENB, RESETB to GND	−0.5	IOVDD + 0.5	
	IOUTAP, IOUTAN, IOUTBP, IOUTBN to GND	−0.7	1.4	
	EXTIO, BIASJ to GND	−0.5	VDDA33 + 0.5	
Temperature	Operating ambient free-air, T _A	−40	85	°C
	Maximum junction, T _J		125	
	Storage, T _{stg}	−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
CLKVDD18	Clock buffer supply	1.71	1.8	1.89	V
DIGVDD18	Digital supply	1.71	1.8	1.89	V
VDDA18	1.8-V analog supply	1.71	1.8	1.89	V
VFUSE	Fuse bank supply	1.71	1.8	1.89	V
IOVDD	IO supply ⁽¹⁾	1.71		3.45	V
VDDA33	3.3-V analog supply	3.15	3.3	3.45	V
T _A	Operating ambient free-air temperature	−40	25	85	°C
T _J	Operating junction temperature ⁽²⁾			105	°C

- (1) Sets CMOS IO voltage levels; nominal 1.8 V, 2.5 V, or 3.3 V.
(2) Prolonged use at this junction temperature may increase the device failure-in-time (FIT) rate.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DAC3174	UNIT
		RGC (VQFN)	
		64 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	23	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	7.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	2.8	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	2.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.2	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics: DC Specifications

Typical values at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 85°C, DAC sample rate = 500 MSPS, 50% clock duty cycle, VDDA33 = IOVDD = 3.3 V, VDDA18 = CLKVDD18 = DIGVDD18 = 1.8 V, and IOUT_{FS} = 20 mA (unless otherwise noted).

otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Resolution			14			Bits
DC ACCURACY						
DNL	Differential nonlinearity	1 LSB = IOUT _{FS} / 2 ¹⁴		±1		LSB
INL	Integral nonlinearity	1 LSB = IOUT _{FS} / 2 ¹⁴		±2		LSB
ANALOG OUTPUTS						
Coarse gain linearity				±0.4		LSB
Offset error		Midcode offset		0.01		%FSR
Gain error	With external reference			±2		%FSR
	With internal reference			±2		
Gain mismatch		With internal reference	−2		2	%FSR
Minimum full-scale output current		Nominal full-scale current, IOUT _{FS} = 16 × IBAIS current		2		mA
Maximum full-scale output current		Nominal full-scale current, IOUT _{FS} = 16 × IBAIS current		20		mA
Output compliance		IOUT _{FS} = 20 mA	−0.5		1	V
Output resistance				300		kΩ
Output capacitance				5		pF
REFERENCE OUTPUT						
V _{REF}	Reference output voltage		1.14	1.2	1.26	V
	Reference output current			100		nA
REFERENCE INPUT						
VEXTIO input voltage		External reference mode	0.1	1.2	1.25	V
Input resistance				1		MΩ
Small-signal bandwidth				500		kHz
Input capacitance				100		pF
TEMPERATURE COEFFICIENTS						
Offset drift				±1		ppm of FSR/°C
Gain drift	With external reference			±15		
	With internal reference			±30		
Reference voltage drift				±8		ppm /°C

Electrical Characteristics: DC Specifications (continued)

Typical values at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, DAC sample rate = 500 MSPS, 50% clock duty cycle, $V_{\text{DDA33}} = \text{IOVDD} = 3.3\text{ V}$, $V_{\text{DDA18}} = \text{CLKVDD18} = \text{DIGVDD18} = 1.8\text{ V}$, and $\text{IOUT}_{\text{FS}} = 20\text{ mA}$ (unless otherwise noted).

7 Detailed Description

7.1 Overview

The DAC3174 device is a dual-channel, 14-bit, 500-MSPS, digital-to-analog converter (DAC), and uses a 14-bit, wide LVDS digital bus with an input FIFO. The data for the two channels are multiplexed onto the 14-bit LVDS bus in a dual-data-rate (DDR) fashion. The DAC3174 also supports a DDR, 7-bit, LVDS interface mode for each channel.

The DAC3174 has separate input data clock for the digital data and sample clock for the analog output. The FIFO input and output pointers can be synchronized across multiple devices for precise signal synchronization. The DAC outputs are current sourcing and terminate to GND with a compliance range of -0.5 V to $+1\text{ V}$. The DAC3174 is pin-compatible with the 12-bit DAC3164 and 10-bit DAC3154, as well as the single-channel DAC31x1 family.

7.2 Functional Block Diagrams

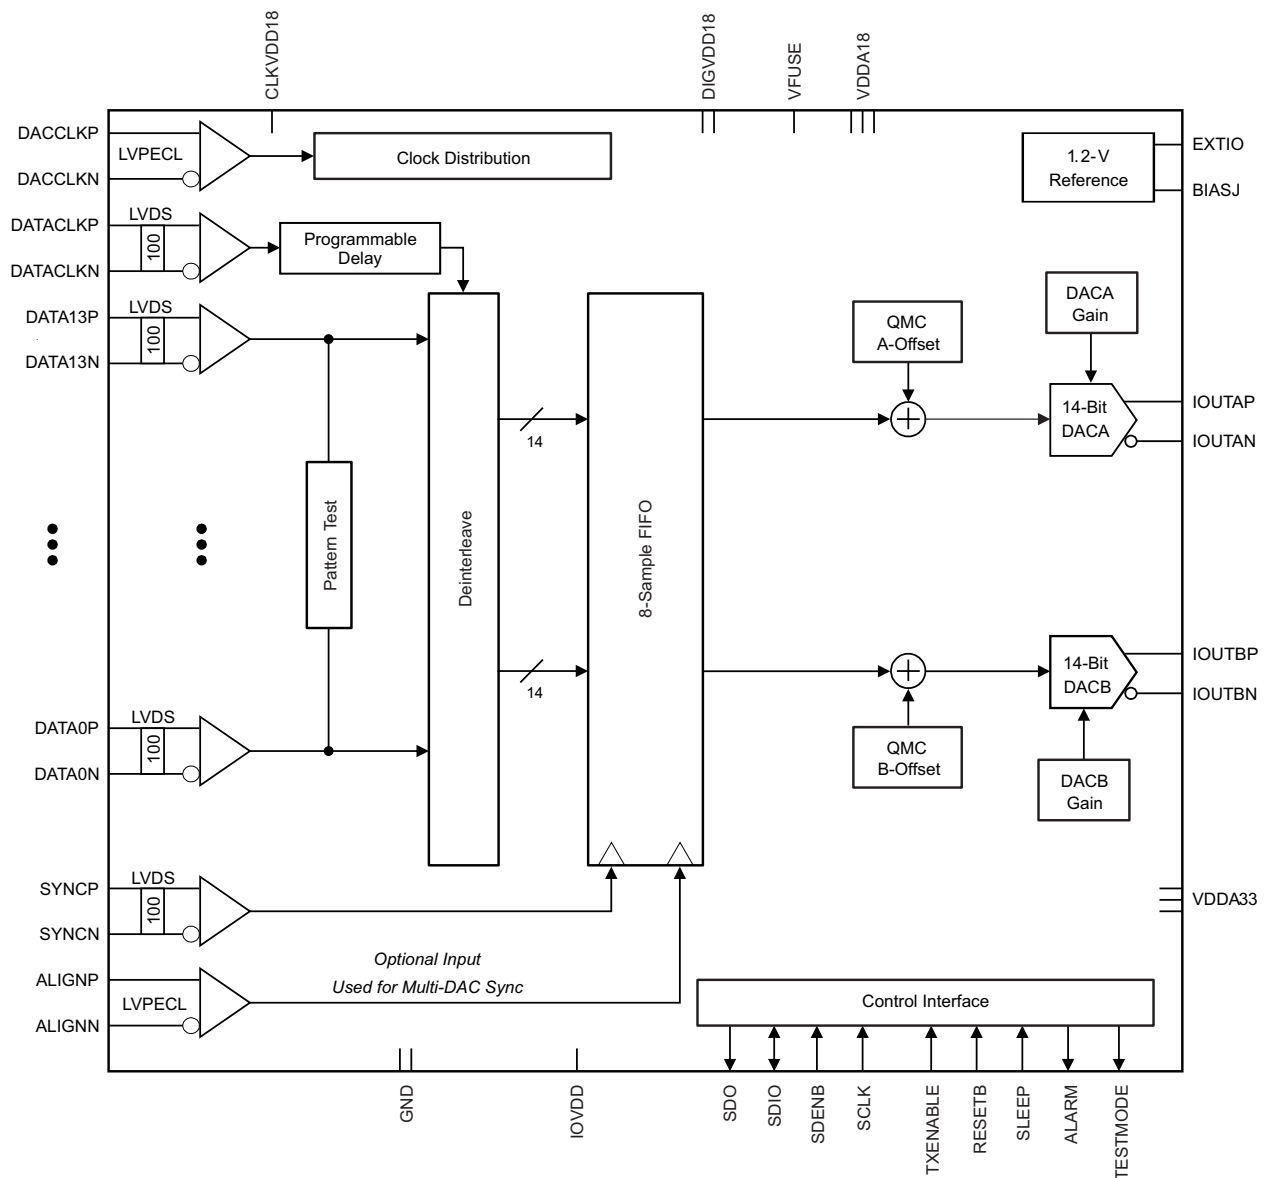

Figure 25. 14-Bit Interface Mode

Functional Block Diagrams (continued)

Figure 26. 7-Bit Interface Mode

7.3 Feature Description

7.3.1 Alarm Monitoring

The DAC3174 includes flexible alarm monitoring that can be used to alert a possible malfunction scenario. All alarm events can be accessed either through the SIP registers and through the ALARM pin. After an alarm is set, the corresponding alarm bit in register config5 must be reset through the serial interface in order to allow further testing. The set of alarms includes the following conditions:

- *Zero check alarm*
 - `Alarm_from_zerock`: Occurs when the FIFO write pointer has an all zeros pattern. Because the write pointer is a shift register, all zeros cause the input point to be stuck until the next sync event. When this happens, a sync to the FIFO block is required.
- *FIFO alarms*
 - `alarm_from_fifo`: Occurs when there is a collision in the FIFO pointers or a collision event is close.
 - `alarm_fifo_2away`: Pointers are within two addresses of each other.
 - `alarm_fifo_1away`: Pointers are within one address of each other.
 - `alarm_fifo_collision`: Pointers are equal to each other.
- *Clock alarms*
 - `clock_gone`: Occurs when either the DACCLK or DATACLOCK have been stopped.
 - `alarm_dacclk_gone`: Occurs when the DACCLK has been stopped.
 - `alarm_dataclk_gone`: Occurs when the DATACLK has been stopped.
- *Pattern checker alarm*
 - `alarm_from_iotest`: Occurs when the input data pattern does not match the pattern key.

To prevent unexpected DAC outputs from propagating into the transmit channel chain, the DAC3174 includes a feature that disables the outputs when a catastrophic alarm occurs. The catastrophic alarms include FIFO pointer collision, the loss DACCLK, or the loss of DATACLK. When any of these alarms occur, the internal TXenable signal is driven low and causes a zeroing of the data going to the DAC in $< 10 T$, where $T = \text{DACCLK period}$. One caveat is that if both clocks stop, the circuit cannot determine clock loss, so no alarms are generated; therefore, no zeroing of output data occurs.

7.4 Device Functional Modes

7.4.1 Data Input Formats

Table 1 through Table 4 list the single and dual bus clock modes of the DAC3174.

Table 1. Single Bus Single Clock Mode

DB1	B8	B1
DB0	B7	B0

NOTE

When rev (config0, bit 11) is asserted, the MSB through the LSB of the input bits are reversed. When using the 14-bit interface, all 14 bits are reversed as one word; when using the 7-bit interface, each of the 7 bits are reversed.

7.4.2 Synchronization Modes

There are three modes of syncing included in the DAC3174:

- *NORMAL Dual Sync*—The SYNCx pin is used to align the input side of the FIFO (write pointers) with the A(0) sample. The ALIGNx pin is used to reset the output side of the FIFO (read pointers) to the offset value. Multiple chip alignment can be accomplished with this kind of syncing.
- *SYNC_ONLY*—In this mode, only the SYNCx pin is used to sync both the read and write pointers of the FIFO. There is an asynchronous handoff between the DATACLK and DACCLK when using this mode; therefore, it is impossible to accurately align multiple chips closer than 2T or 3T, where T = DACCLK period.
- *SIF_SYNC*— When neither SYNCx nor ALIGNx are used, a programmable synchronizing pulse is used to synchronize the design. However, the same issues for SYNC_ONLY mode apply. There is an asynchronous handoff between the serial clock domain and the two sides of the FIFO. Because of the asynchronous nature of SIF_SYNC method, it is impossible to align the sync with any sample at the input. SIF_SYNC mode is the only synchronization mode supported in dual-bus mode.

NOTE

When ALIGNP and ALIGNN are not used, TI recommends clearing alignrx_ena (config 1, bit 4), tying ALIGNP to DIGVDD18, and tying ALIGNN to ground. When SYNCp and SYNCn are not used, TI recommends clearing syncrx_ena (config 0, bit 3). Then, the unused SYNCp and SYNCn pins can be left open or tied to ground.

7.5 Programming

7.5.1 Initialization

The following startup sequence is recommended to power-up the DAC3174:

1. Set TXENABLE low to prevent spurious output while initializing the device.
2. Supply all 1.8-V voltages (VDDA18, DIGVDD18, CLKVDD18, and VFUSE) and all 3.3-V voltages (VDDA33, IOVDD, and PLLAVDD). Power IOVDD with a supply range of 1.8 V to 3.3 V. The 1.8-V and 3.3-V supplies can be powered up simultaneously, or in any order. There are no specific requirements on the ramp rate for the supplies.
3. Provide all LVPECL inputs: DACCLKP, DACCLKN, and the optional ALIGNP and ALIGNN. These inputs can also be provided after the SIF register programming.
4. Toggle the RESETB pin active low for a minimum pulse duration of 25 ns.
5. Program the SIF registers.
6. Make sure the FIFO pointers are properly initialized using one of the following methods:
 - (a) SYNCx and ALIGNx inputs
 - (b) SYNC-only input
 - (c) sif_sync programming with SYNC_only mode
7. Set TXENABLE high.

7.5.2 Serial Interface Description

The serial port of the DAC3174 is a flexible serial interface that communicates with industry-standard microprocessors and microcontrollers. The interface provides read or write access to all registers used to define the operating modes of DAC3174. The interface is compatible with most synchronous transfer formats and can be configured as a 3- or 4-pin interface by sif4_ena (register config0, bit 9). In both configurations, SCLK is the serial interface input clock, and SDENB is serial interface enable. For 3-pin configuration, SDIO is a bidirectional pin for both data in and data out. For 4-pin configuration, SDIO is data in only, and SDO is data out only. Data are input into the device with the rising edge of SCLK. Data are output from the device on the falling edge of SCLK.

Each read or write operation is framed by signal SDENB (serial data enable bar) asserted low. The first frame byte is the instruction cycle that identifies the following data transfer cycle as read or write, as well as the 7-bit address to be accessed. [Table 5](#) indicates the function of each bit in the instruction cycle, and is followed by a detailed description of each bit. The data transfer cycle consists of two bytes.

Table 5. Instruction Byte of the Serial Interface

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
Description	R/W	A6	A5	A4	A3	A2	A1	A0

R/W Identifies the following data transfer cycle as a read or write operation. A high indicates a read operation from the DAC3174, and a low indicates a write operation to the DAC3174.

[A6:A0] Identifies the address of the register to be accessed during the read or write operation.

Figure 27 shows the serial interface timing diagram for a DAC3174 write operation. SCLK is the serial interface clock input to the DAC3174. Serial data enable SDENB is an active low input to the DAC3174. SDIO is serial data in. Input data to the DAC3174 is clocked on the rising edges of SCLK.

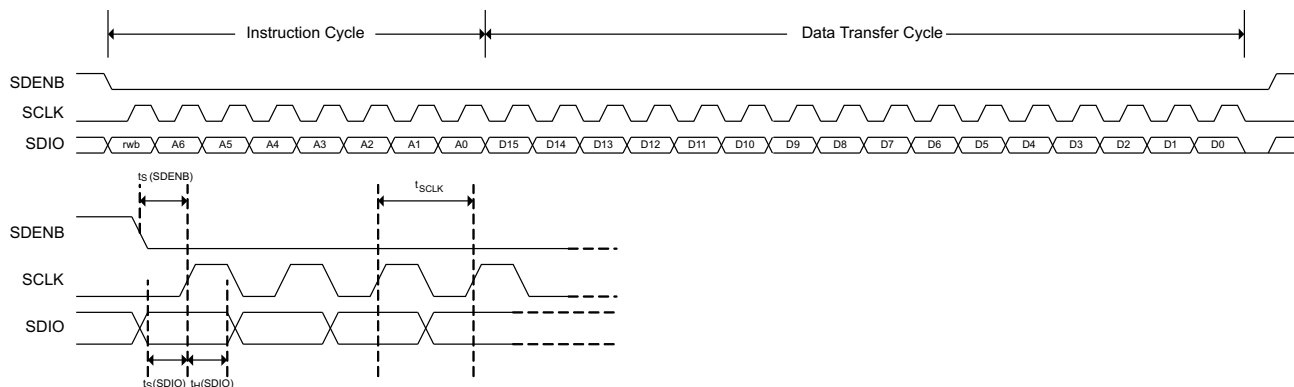

Figure 27. Serial Interface Write Timing Diagram

Figure 28 shows the serial interface timing diagram for a DAC3174 read operation. SCLK is the serial interface clock input to the DAC3174. Serial data enable SDENB is an active low input to the DAC3174. SDIO is serial data in during the instruction cycle. In 3-pin configuration, SDIO is data out from the DAC3174 during the data transfer cycle, while SDO is in a high-impedance state. In 4-pin configuration, both SDIO and SDO are data out from the DAC3174 during the data transfer cycle. At the end of the data transfer, SDIO and SDO output low on the final falling edge of SCLK until the rising edge of SDENB when they become high impedance.

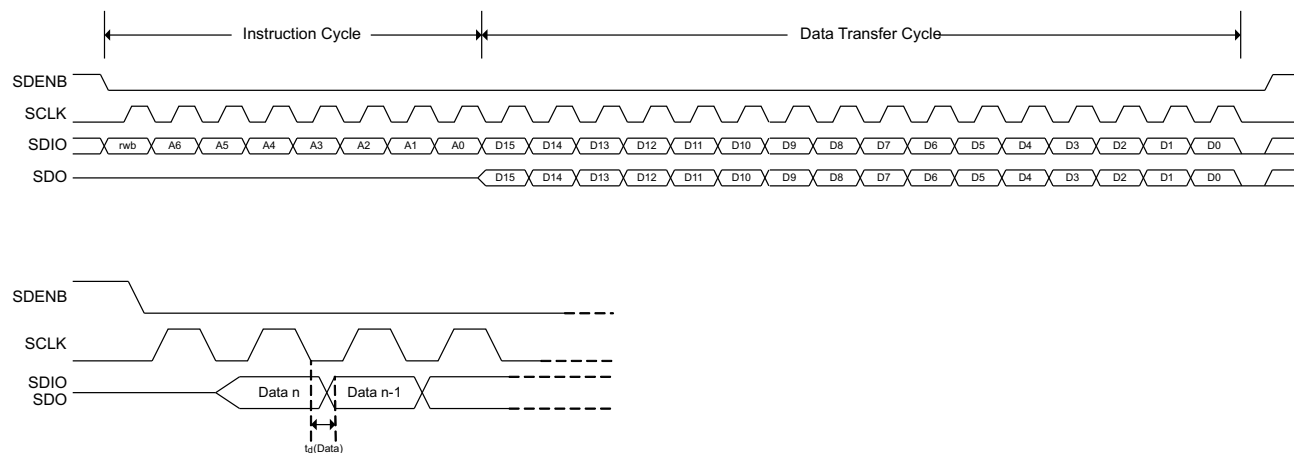

Figure 28. Serial Interface Read Timing Diagram

7.6 Register Maps

[Table 6](#) lists the register maps for the DAC3174.

In the SIF interface, there are three types of registers:

1. *NORMAL*

- The *NORMAL* register type allows data to be written and read from. All 16-bits of the data are registered at the same time. There is no synchronizing with an internal clock thus all register writes are asynchronous with respect to internal clocks. There are three subtypes of *NORMAL*:
 - *AUTOSYNC*: A *NORMAL* register that causes a sync to be generated after the write is finished. These are most commonly used in things like offsets and phaseadd, where there is a word or block setup that extends across multiple registers, and all of the registers required to be programmed before any take effect on the circuit. For example, the phaseadd is two registers long. There is no benefit to have the first write 16 of the 32 bits cause a change in the frequency, so the design allows all the registers to be written. When the last register write for this block is finished, an autosync is generated for the mixer to read all the new SIF values. This occurs on a mixer clock cycle so that no metastability errors occur.
 - *No RESET Value*: These are *NORMAL* registers, but for one reason or another, the reset value can not be ensured. The reason may be because the register has some read-only bits, or some internal logic partially controls the bit values. An example is the SIF_CONFIG6 register. The bits come from the temperature sensor and the fuses. Depending on which fuses are blown and what the die temperature is, the reset value is different.
 - *FUSE controlled*: While not a type of register, fuses can affect what is read as the default value. The default values shown in this data sheet are for when no fuses are blown.

2. *READ_ONLY*

- Registers that are internal wires ANDed with the address bus, and then connected to the SIF output data bus.

3. *WRITE_TO_CLEAR*:

- These registers are just like *NORMAL* registers with one exception: these registers can be written and read. However, when the internal logic asynchronously sets a bit high in one of these registers, that bit stays high until written to 0. In this way, interrupts are captured and stay constant until cleared by the user.

		14	dual_ena	Uses both DACs when asserted.	1 (FUSE controlled)
		13:12	chipwidth	Programmable bits for setting the input interface width: 00: all 14 bits are used 01: upper 12 bits are used 10: upper 10 bits are used 11: upper 10 bits are used.	00
		11	rev	Reverses the input bits. When using the 7-bit interface, this reverse each 7-bit input, however when using the 14-bit interface, all 14-bits are reversed as one word.	0
		10	twos	When asserted, this bit tells the chip to presume 2's complement data are arriving at the input. Otherwise offset binary is presumed.	1
		9	sif4_ena	When asserted the SIF interface becomes a 4-pin interface. This bit has a lower priority than the <i>dieid_ena</i> bit.	0
		8	reserved	Reserved	0
		7	fifo_ena	When asserted, the FIFO is absorbing the difference between INPUT clock and DAC clock. If it is not asserted then the FIFO buffering is bypassed but the reversing of bits and handling of offset binary input is still available. NOTE: When the FIFO is bypassed the DACCLK and DATACLK must be aligned or there may be timing errors; and, it is not recommended for actual application use.	1
		6	alarm_out_ena	When asserted the pin alarm becomes an output instead of a tri-state pin.	1
		5	alarm_out_pol	This bit changes the polarity of the ALARM signal (0 = negative logic, 1 = positive logic).	1
		4	alignrx_ena	When asserted the ALIGN pin receiver is powered up. NOTE: TI recommends clearing this bit when ALIGNP/N are not used (dual bus mode, and SYNC ONLY and SIF_SYNC modes in single bus mode).	1
		3	syncrx_ena	When asserted the SYNC pin receiver is powered up NOTE: TI recommends clearing this bit when SYNC P/N are not used (dual bus mode, and SIF_SYNC mode in single bus mode).	1
		2	lvdsdataclk_ena	When asserted the DATACLK pin receiver is powered up.	1
		1	reserved	Reserved	0
		0	synconly_ena	When asserted the chip is put into the SYNC ONLY mode where the SYNC ONLY pin is used as the sync input for both the front and back of the FIFO.	0

7.6.2 config 1 Register (address = 0x01) [reset = 0x600E]

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Table 8. config1 Register Field Descriptions

REG NAME	ADDR (HEX)	BIT	NAME	FUNCTION	DEFAULT VALUE
config1	0x01	15	iotest_ena	Turns on the io-testing circuitry when asserted. This is the circuitry that compares an 8-sample input pattern to SIF programmed registers to make sure the data coming into the chip meets setup and hold requirements. If this bit is a 0 then the clock to this circuitry is turned off for power savings. NOTE: Sample 0 must be aligned with the rising edge of SYNC.	0
		14	bsideclk_ena	When asserted the input clock for the B side datapath is enabled. Otherwise the IOTEST and the FIFO on the B-side of the design does not get a clock.	1
		13	fullwordinterface_ena	When asserted the input interface is changed to use the full 14-bits for each word, instead of dual, 7-bit buses for two half-words.	1
		12	64cnt_ena	This enables the resetting of the alarms after 64 good samples with the goal of removing unnecessary errors. For instance on a lab board, when checking the setup and hold through IOTEST, there may initially be errors, but once the test is up and running everything works. Setting this bit removes the requirement for a SIF write to clear the alarm register.	0
		11	dacclkgone_ena	This allows the DACCLK gone signal from the clock monitor to be used to shut the output off.	0
		10	dataclkgone_ena	This allows the DATACLK gone signal from the clock monitor to be used to shut the output off.	0
		9	collision_ena	This allows the collision alarm from the FIFO to shut the output off.	0
		8	reserved	Reserved	0
		7	daca_compliment	When asserted the output to the DACA is complimented. This allows the user of the chip to effectively change the + and – designations of the DAC output pins.	0
		6	dacb_compliment	When asserted the output to the DACB is complimented. This allows the user of the chip to effectively change the + and – designations of the DAC output pins.	0
		5	sif_sync	This is the SIF_SYNC signal. Whatever is programmed into this bit is used as the chip sync when SIF_SYNC mode is enabled. Design is sensitive to rising edges so programming from 0 → 1 is when the sync pulse is generated. 1 → 0 has no effect.	0
		4	sif_sync_ena	When asserted enable SIF_SYNC mode.	0
		3	alarm_2away_ena	When asserted, alarms from the FIFO that represent the pointers being 2 away are enabled.	1
		2	alarm_1away_ena	When asserted, alarms from the FIFO that represent the pointers being 1 away are enabled.	1
		1	alarm_collision_ena	When asserted, the collision of FIFO pointers causes an alarm to be generated.	1
		0	reserved	Reserved	0

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DAC3174 is a single-channel, 14-bit, 500-MSPS DAC with a flexible input interface (full SDR, 14-bit interface; or DDR, 7-bit interface). DAC3174 supports independent input data clock and output DAC clock, and the FIFO can be used to absorb the timing difference of two clock domains. The DAC3174 can be widely used in many applications, such as real-IF transmitter for wireless infrastructure, arbitrary waveform generator, radar, cable head-end equipment, and so on.

8.2 Typical Application

Figure 56 below shows an example block diagram of the DAC3174 used as a real IF transmitter to generate a modulated communication signal.

Copyright © 2017, Texas Instruments Incorporated

Figure 56. Real IF Transmitter

8.2.1 Design Requirements

A single-carrier, WCDMA-modulated waveform of 5-MHz bandwidth must be created. The WCDMA signal is modulated up to a 900-MHz carrier using a real mixer. A real mixer creates two images of the signal about the carrier frequency and some bleed-through of the local oscillator (LO); therefore, a band-pass filter is used to filter out the undesired signal image and the local oscillator.

Typical Application (continued)

8.2.2 Detailed Design Procedure

The data pattern file that represents the desired 5-MHz, single-carrier, WCDMA signal is created with a pattern generation. [Figure 56](#) shows the DAC3174 being clocked by an FPGA. The data pattern file is generated with the 5-MHz, WCDMA signal centered at an intermediate frequency of 100 MHz, and a local oscillator of 800 MHz is used to upconvert the modulated signal to 900 MHz. The real mixer creates an image of the desired signal centered about 700 MHz, and there is also a LO feedthrough spur present at 800 MHz. [Figure 57](#) illustrates a band-pass filter following the mixer that is required to remove the lower image of the signal and the LO feedthrough spur.

Figure 57. Signal Spectrum in a Real IF Transmitter

The choice of the intermediate frequency has an impact on the design of the 900-MHz bandpass filter. The band-pass filter passes the WCDMA signal image that is centered at 900 MHz, but provides significant attenuation of the local oscillator feedthrough and the signal image. The distance between the signal and the image is equal to twice the intermediate frequency. If the intermediate frequency is too low, the image gets too close to the signal; therefore, a higher-order band-pass filter with steep rolloff is required. If the intermediate frequency is too high, the image is further away from the signal, but the signal is too far out towards the end of the Nyquist zone, and the $\sin x/x$ distortion becomes an issue. Centering the DAC output signal at an intermediate frequency of 100 MHz is a good, balanced choice in this example, and makes the design of the band-pass filter reasonably easy.

The DAC3174 does not have an interpolation option, so the data rate for the sample data are the same rate as the sample rate to the DAC3174. In this case, choose a sample rate of 500 MSPS (a commonly used telecommunications sample rate), so that the sample data rate into the DAC3174 is also 500 MSPS.

Typical Application (continued)

8.2.3 Application Curve

Figure 58 shows the DAC output ACPR of a single-carrier, WCDMA-modulated signal centered at an intermediate frequency of 100 MHz.

Figure 58. Single-Carrier, WCDMA Signal ACPR at 100 MHz

9 Power Supply Recommendations

The DAC3174 uses as many as three different power-supply voltages. Some of the DAC power supplies are noise sensitive. Table 34 is a summary of the various power supplies of the DAC. See the evaluation module schematics for an example power-supply implementation. Take care to keep clean power supply routing away from noisy digital supplies. Avoid placing digital supplies and clean supplies on adjacent board layers and use a ground layer between noisy and clean supplies, if possible. All supplies pins must be decoupled as close to the pins as possible using small value capacitors, with larger bulk capacitors placed further away.

Table 34. DAC Power Supplies

POWER SUPPLY	VOLTAGE	NOISE SENSITIVE	RECOMMENDATION
IOVDD	1.8 V to 3.3 V	No	Digital supply (keep separate from noise-sensitive supplies)
CLKVDD18	1.8 V	Yes	Provide clean voltage and avoid spurious noise
DIGVDD18	1.8 V	No	Digital supply (keep separate from noise-sensitive supplies)
VDDA18	1.8 V	Yes	Provide clean voltage and avoid spurious noise
VDDDA33	3.3 V	Yes	Provide clean voltage and avoid spurious noise
VFUSE	1.8 V	No	Digital supply, connect to DIGVDD18

10 Layout

10.1 Layout Guidelines

- DAC output termination resistors must be placed as close to the output pins as possible to provide a dc path to ground and set the source impedance.
- Route the LVDS data signals as impedance-controlled, tightly-coupled, matched-length differential traces.
- Maintain a solid ground plane under the LVDS signals without any ground plane splits.
- Place a thermal ground pad under the device with an adequate number of vias to the ground planes of the board.

10.2 Layout Example

Figure 59. DAC3174 Layout Example

11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

Adjacent Carrier Leakage Ratio (ACLR): Defined as the ratio in decibels relative to the carrier (dBc) between the measured power within a channel and that of its adjacent channel.

Analog and Digital Power Supply Rejection Ratio (APSSR, DPSSR): Defined as the percentage error in the ratio of the delta IOUT and delta supply voltage normalized with respect to the ideal IOUT current.

Differential Nonlinearity (DNL): Defined as the variation in analog output associated with an ideal 1 LSB change in the digital input code.

Gain Drift: Defined as the maximum change in gain, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Gain Error: Defined as the percentage error (in FSR%) for the ratio between the measured full-scale output current and the ideal full-scale output current.

Integral Nonlinearity (INL): Defined as the maximum deviation of the actual analog output from the ideal output, determined by a straight line drawn from zero scale to full scale.

Intermodulation Distortion (IMD3): The two-tone IMD3 is defined as the ratio (in dBc) of the 3rd-order intermodulation distortion product to either fundamental output tone.

Offset Drift: Defined as the maximum change in DC offset, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Offset Error: Defined as the percentage error (in FSR%) for the ratio between the measured mid-scale output current and the ideal mid-scale output current.

Output Compliance Range: Defined as the minimum and maximum allowable voltage at the output of the current-output DAC. Exceeding this limit may result reduced reliability of the device or adversely affecting distortion performance.

Reference Voltage Drift: Defined as the maximum change of the reference voltage in ppm per degree Celsius from value at ambient (25°C) to values over the full operating temperature range.

Spurious Free Dynamic Range (SFDR): Defined as the difference (in dBc) between the peak amplitude of the output signal and the peak spurious signal.

Signal to Noise Ratio (SNR): Defined as the ratio of the RMS value of the fundamental output signal to the RMS sum of all other spectral components below the Nyquist frequency, including noise, but excluding the first six harmonics and dc.

11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC3174IRGCR	ACTIVE	VQFN	RGC	64	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3174I	Samples
DAC3174IRGCT	ACTIVE	VQFN	RGC	64	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3174I	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
